RE: Waterfront at Lake Havasu

Traffic Statement

1. INTRODUCTION

Lōkahi, LLC (Lōkahi) has prepared this Traffic Statement for the proposed Waterfront at Lake Havasu development, located on the southwest corner of McCulloch Boulevard and Beachcomber Boulevard in Lake Havasu City, Arizona. See **Figure 1** for the vicinity map.

To assess projected traffic impacts of the proposed Waterfront at Lake Havasu development,

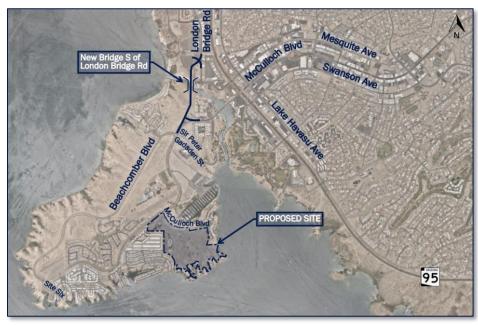

Figure 1 – Vicinity Map

this Traffic Statement draws from the analyses and findings presented in the Lake Havasu City Second Bridge Feasibility Study (LHC/ADOT Feasibility Study), completed in July 2024. This LHC/ADOT Feasibility Study was initiated by Lake Havasu City in coordination with the Arizona Department of Transportation (ADOT) and funded through a \$35.5 million state appropriation under Senate Bill 1722. The LHC/ADOT Feasibility Study was an extensive planning effort, incorporating technical modeling, stakeholder feedback, and public engagement. The LHC/ADOT Feasibility Study outlined the need for the second bridge for emergency and evacuation purposes for scenarios that the London Bridge crossing was unpassable or experienced extensive access delay conditions for emergency and public safety.

The proposed Waterfront at Lake Havasu development is estimated to be fully built out between 2030 and 2032. The planned second bridge – currently underway – is expected to be constructed and operational before that time. Because the bridge will significantly alter access and circulation patterns on the island, evaluating future traffic conditions based on current patterns would not provide an accurate picture.

The most effective approach is to compare the proposed development's land uses with the assumptions and findings of the Lake Havasu Second Bridge Feasibility Study, which modeled future conditions for 2030. This method offers the most relevant and reliable basis for understanding how traffic will function in the area once the bridge is in place.

2. EXECUTIVE SUMMARY

The traffic-related impacts of the proposed Waterfront at Lake Havasu development have been evaluated in the context of the Lake Havasu City Second Bridge Feasibility Study, completed in July 2024. Initiated by the City of Lake Havasu in coordination with the Arizona Department of Transportation (ADOT) and funded through a \$35.5 million state appropriation under Senate Bill 1722, the LHC/ADOT Feasibility Study was a robust and comprehensive planning effort. It incorporated detailed technical modeling, stakeholder input, and public engagement. The LHC/ADOT Feasibility Study outlined the need for the second bridge for emergency and evacuation purposes for scenarios that the London Bridge crossing was unpassable or experienced extensive access delay conditions for emergency and public safety.

At the time of the LHC/ADOT Feasibility Study, the development plan for the 91-acre site was still in the early stages of planning. However, the Waterfront at Lake Havasu team maintained close coordination with the City of Lake Havasu, and the Second Bridge project team to provide timely input on preliminary land use and site planning details. This collaborative effort helped ensure the study reflected informed, reasonable assumptions representative of anticipated development.

Since that time, the development plan has been refined—resulting in fewer residential units and a slight increase in commercial space compared to what was assumed in the LHC/ADOT Feasibility Study. A comparative analysis confirms that the proposed Waterfront at Lake Havasu development will generate fewer overall daily and peak-hour trips than the scenario originally modeled in the LHC/ADOT Feasibility Study.

Accordingly, the LHC/ADOT Feasibility Study's traffic analysis projected 2030 daily volumes based on a more intensive development scenario and full build-out of the second bridge. The capacity analysis concluded that all roadways on the island and adjacent mainland will continue to operate at acceptable levels of service, with available roadway capacity ranging from 37% to 92%.

- These findings confirm that the surrounding roadway network is well-equipped to
 accommodate traffic from the proposed development. Because the LHC/ADOT
 Feasibility Study assumed more traffic-intensive land uses for the 91-acre site, the
 proposed Waterfront at Lake Havasu development is expected to result in even less
 traffic-related impact than originally projected—further supporting the conclusion
 that no adverse impacts to the transportation system are anticipated.
- The Second Bridge effectively will mitigate the proposed Waterfront at Lake Havasu's traffic impacts.

- The LHC/ADOT Second Bridge Feasibility Study recommends improvements to the intersection of McCulloch Boulevard and the second bridge new roadway alignment/Beachcomber Boulevard.
- This Traffic Statement provides a high-level analysis of the future roadway network.
 More detailed traffic analyses of site driveways—including traffic operations, traffic controls, lane configurations, turn-lane storage requirements and lengths—should be completed once the site plan is further defined. All site access points should be evaluated to provide acceptable ingress and egress operations, queue storage, and traffic control.

3. EXISTING CONDITIONS

The site is a vacant 91-acre parcel (APN 107-15-015) located on the southern portion of Lake Havasu Island. It is currently zoned GC (Golf Course) and lies west of McCulloch Boulevard and south of Beachcomber Boulevard.

McCulloch Boulevard

McCulloch Boulevard is an east-west roadway serving as the only existing connection between Lake Havasu City's mainland and Lake Havasu Island.

Roadway Segment Adjacent to the Site (Beachcomber Boulevard to The Nautical Beachfront Resort)

The segment of McCulloch Boulevard directly adjacent to the site provides one (1) through lane in each direction of travel. According to the Lake Havasu Metropolitan Planning Organization (MPO) 2045 Regional Transportation Plan, dated February 2022, this roadway segment is functionally classified as a local road. The posted speed limit is 25 miles per hour (mph).

BEACHCOMBER BOULEVARD

Beachcomber Boulevard forms a loop around Lake Havasu Island. The north and south loops both run from the McCulloch Boulevard intersection to Site Six. According to the Lake Havasu MPO 2045 Regional Transportation Plan, the loop carries fewer than 5,000 vehicles per day (vpd).

Roadway Segment Adjacent to the Site (South Loop – Islander Resort to McCulloch Boulevard)

The segment of Beachcomber Boulevard directly adjacent to the site and between the Islander Resort and McCulloch Boulevard, provides two (2) through lanes in each direction of travel. According to the *Lake Havasu MPO 2045 Regional Transportation Plan*, the south loop is functionally classified as a major collector. The posted speed limit is 35 mph.

Refer to **Figure 2** and **Figure 3** for the functional roadway classifications and number of lanes as provided in the *Lake Havasu MPO 2045 Regional Transportation Plan. See Figure 4 for 2022 daily traffic volumes reported in the LHC/ADOT Feasibility Study.*

Figure 2 – Functional Classification (Lake Havasu MPO Regional Transportation Plan)

Figure 4 Year 2022 Daily Traffic Volumes (LHC/ADOT Feasibility Study)

Legend X,XXX Average Daily Traffic (vehicles per day)

4. PROPOSED DEVELOPMENT

The proposed Waterfront at Lake Havasu development is located on an approximately 91-acre site on Lake Havasu Island, at the southwest corner of McCulloch Boulevard and Beachcomber Boulevard. The project is estimated to be built out between 2030 and 2032.

The proposed development is anticipated to consist of the following land uses:

Commercial Land Use – 187,200 sq. ft.

Market: 22,000 sq. ft.Retail: 45,100 sq. ft.

• Resort: 120,100 sq. ft.

Residential Land Use – 298 Dwelling Units

Resort Villas: 15 DU
Multi-Family: 90 DU
Townhomes: 38 DU
Small Lots: 84 DU
Medium Lots: 50 DU

Large Lots: 21 DU

See **Figure 5** and **Attachment A** for the general development plan.

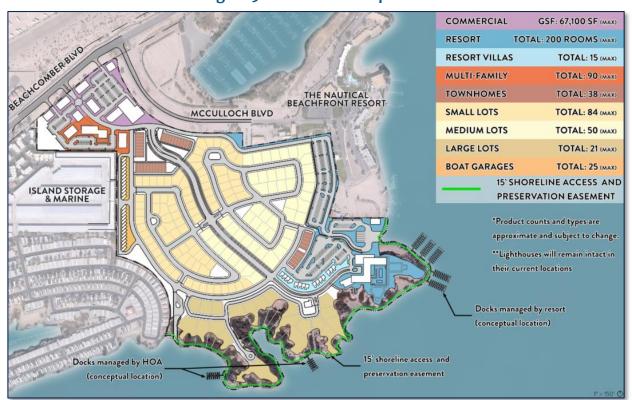

Figure 5 - General Development Plan

4.1 TRIP GENERATION – PROPOSED DEVELOPMENT

Trip generation for the proposed development was calculated utilizing the Institute of Transportation Engineers (ITE) publication entitled *Trip Generation*, 12th Edition. The ITE trip generation rates and fitted curve equations are based on studies that measure trip generation characteristics for various types of land uses. The rates are expressed in terms of trips per unit of land use type. This publication is the standard for the transportation engineering profession.

INTERNAL TRIPS

Given the mixed-use nature of the proposed development, a portion of the trips are expected to occur internally between the residential, retail, and resort components on-site. Internal capture rates from NCHRP Report 684 – Enhancing Internal Trip Capture Estimation for Mixed-Use Developments were applied to the AM and PM peak hours. Daily internal capture was calculated using the average of the AM and PM peak hour capture rates.

Trip generation estimates are based on the approximate product types and counts shown in **Figure 5** and are subject to change. The proposed development is anticipated to generate a total of 3,446 new weekday trips, including 134 trips during the AM peak hour and 265 trips during the PM peak hour. See **Table 1** and **Attachment B** for detailed calculations.

| Land Use | ITE | Otv | Unit | Weekday | AM | Peak H | Hour | PM | Peak H | Hour |
|--|-----|------|-----------------|---------|-------|--------|------|-------|--------|------|
| Land Ose | LUC | Qty | Offic | Total | Total | In | Out | Total | In | Out |
| Resort Hotel | 330 | 200 | Rooms | 534 | 66 | 46 | 20 | 78 | 34 | 44 |
| Shopping Plaza | 821 | 45.1 | 1000 Sq Ft GFA | 1,952 | 13 | 8 | 5 | 115 | 56 | 59 |
| Market | 850 | 22.0 | 1000 SF GFA | 662 | 20 | 12 | 8 | 68 | 34 | 34 |
| Recreational Homes (Single-Family Lots/Resort Villas) | 260 | 170 | Dwelling Units | 665 | 30 | 10 | 20 | 55 | 31 | 24 |
| Multifamily Housing | 221 | 90 | Dwelling Units | 338 | 14 | 3 | 11 | 23 | 15 | 8 |
| Townhomes | 215 | 38 | Dwelling Units | 182 | 5 | 1 | 4 | 6 | 3 | 3 |
| | | | Subtotal | 4,333 | 148 | 80 | 68 | 345 | 173 | 172 |
| | | | Internal Trips | 887 | 14 | 7 | 7 | 80 | 40 | 40 |
| Tota | | | velopment Trips | 3,446 | 134 | 73 | 61 | 265 | 133 | 132 |

^{*} Based on approximate product types and counts; subject to change.

5. SECOND BRIDGE FEASIBILITY STUDY

Currently, London Bridge is the only existing vehicular connection between Lake Havasu's mainland and the island. The LHC/ADOT Feasibility Study outlined the need for the second bridge for emergency and evacuation purposes for scenarios that the London Bridge crossing was unpassable or experienced extensive access delay conditions for emergency and public safety. The LHC/ADOT Feasibility Study evaluated alternatives for a second bridge and included a comprehensive assessment to identify a preferred alignment and analysis of how the second bridge would affect future travel patterns. The selected alignment is shown in **Figure 6**.

As part of the LHC/ADOT Feasibility Study, Michael Baker International, in association with Kittelson & Associates, conducted a detailed travel demand model analysis using VISSIM software. This analysis evaluated roadway capacity and operational characteristics under existing conditions, as well as future conditions in 2030 and 2045 with the second bridge in place. The modeling assumed the second bridge would divert a portion of traffic from London Bridge, thereby reducing congestion and improving circulation between the island and the mainland.

The traffic analysis was based on the Lake Havasu Metropolitan Planning Organization's (LHMPO) 2022 Regional Travel Demand Model, developed as part of the 2045 Regional Transportation Plan. The model network and socioeconomic inputs were updated to reflect current conditions and validated using recent traffic count data. Future year projections incorporated the latest land use plans and anticipated development activity for Lake Havasu Island and surrounding areas.

This effort was a comprehensive and collaborative process involving the City of Lake Havasu, the Lake Havasu Metropolitan Planning Organization (LHMPO), the consultant team of Michael Baker International in association with Kittelson & Associates, the public, and the Waterfront at Lake Havasu development team. Together, these stakeholders provided critical input to ensure the model reflected the most reasonable and informed assumptions regarding land use, development timelines, and projected growth patterns.

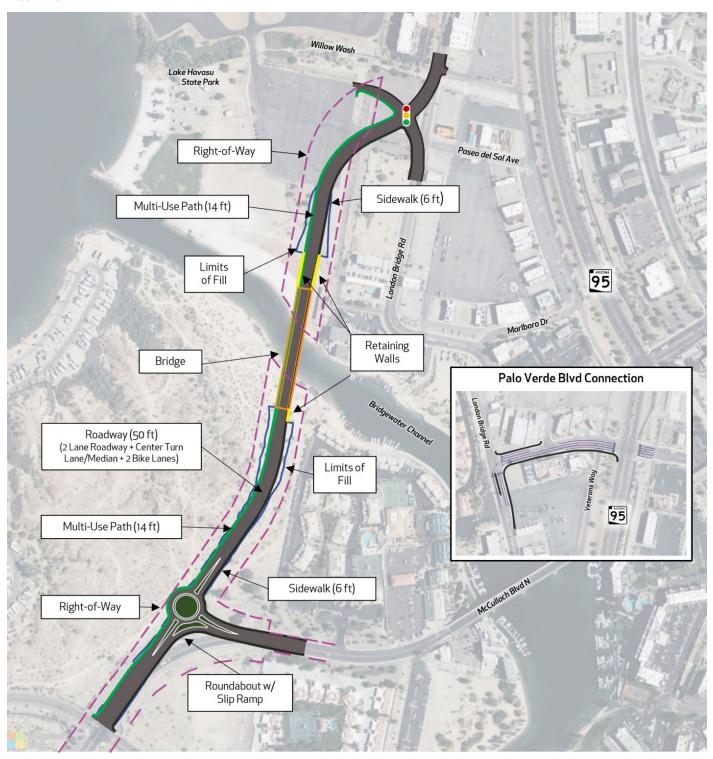

As part of the modeling, the 91-acre site proposed for the Waterfront at Lake Havasu development was assumed to include:

Commercial Land Use – 172,200 sq. ft.

Residential Land Use – 475 Dwelling Units

FIGURE 26: PREFERRED ALTERNATIVE

5.1 TRIP GENERATION – LHC/ADOT FEASIBILITY STUDY

The LHC/ADOT Feasibility Study assumed the 91-acre site would include:

Commercial Land Use – 172,000 sq. ft.

Residential Land Use - 475 Dwelling Units

At the time the LHC/ADOT Feasibility Study was completed in July 2024, the proposed land uses and concept site plan for the Waterfront at Lake Havasu development were still in the early stages of planning. Throughout the process, the Waterfront at Lake Havasu team maintained close coordination with the Second Bridge project team—including Michael Baker International and the City of Lake Havasu—providing ongoing updates, land use details, and planning information to support a well-informed and representative model. These collaborative efforts helped ensure that the assumptions used in the LHC/ADOT Feasibility Study aligned with the initial development vision of the Waterfront at Lake Havasu and reflected the best available information at the time.

Since the LHC/ADOT Feasibility Study's completion, the Waterfront at Lake Havasu's development plan has been further refined. As described previously, the proposed Waterfront at Lake Havasu is now anticipated to consist of the following land uses:

Commercial Land Use – 187,200 sq. ft.

• Market: 22,000 sq. ft.

• Retail: 45,100 sq. ft.

• Resort: 120,100 sq. ft.

Residential Land Use – 298 Dwelling Units

• Resort Villas: 15 DU

• Multi-Family: 90 DU

• Townhomes: 38 DU

Small Lots: 84 DU

• Medium Lots: 50 DU

• Large Lots: 21 DU

Table 2 provides a comparison between the land use assumptions used in the LHC/ADOT Feasibility Study and the land uses currently proposed for the Waterfront at Lake Havasu development.

Compared to the current proposal, the proposed development assumes **9**% **more commercial square footage** and **37**% **less residential dwelling units**.

Table 2 – Land Use Comparison

| Land Use | Commercial (Sq. Ft.) | Residential (DU) |
|----------------------------|-------------------------|---------------------|
| Proposed Development | 187,200 | 298 |
| LHC/ADOT Feasibility Study | 172,200 | 475 |
| Difference | 9% | -37% |

Commercial Land Use

To estimate the commercial trip generation for the LHC/ADOT Feasibility Study's land use assumptions for the 91-acre site, the proposed Waterfront at Lake Havasu development's commercial trip generation was adjusted to reflect a 9% reduction in commercial square footage. See **Table 3** for the LHC/ADOT Feasibility Study's commercial trip generation calculations.

Table 3 – Trip Generation (LHC/ADOT Feasibility Study Commercial Development)

| Land Use | ITE | Qty | Unit | Weekday | AM | Peak H | Hour | PM | Peak F | lour |
|--------------------|------------------------|--------|------------------|-------------|-------|--------|------|-------|--------|------|
| Land Ose | LUC | –qty | Offic | Total | Total | In | Out | Total | In | Out |
| Pr | oposed | Devel | opment Comme | ercial Trip | S | | | | | |
| Resort Hotel | 330 | 200 | Rooms | 534 | 66 | 46 | 20 | 78 | 34 | 44 |
| Shopping Plaza | 821 | 45.1 | 1000 Sq Ft GFA | 1,952 | 13 | 8 | 5 | 115 | 56 | 59 |
| Market | 850 | 22 | 1000 SF GFA | 662 | 20 | 12 | 8 | 68 | 34 | 34 |
| | | | Subtotal | 3,148 | 99 | 66 | 33 | 261 | 124 | 137 |
| | | | Internal Trips | 590 | 8 | 4 | 4 | 47 | 17 | 30 |
| Total Proposed I | Develop | ment C | ommercial Trips | 2,558 | 91 | 62 | 29 | 214 | 107 | 107 |
| LHC | ADOT I | Feasib | ility Study Comr | nercial Tri | ips | | | | | |
| Total LHC/ADOT Fea | 2,353 | 84 | 57 | 27 | 196 | 98 | 98 | | | |
| | Commercial Differen | | | | | | | | | 9 |
| | Commercial % Differenc | | | | | | | 9% | 9% | 9% |

The commercial development in the LHC/ADOT Feasibility Study for the 91-acre site is anticipated to generate a total of 2,353 weekday trips, including 84 trips during the AM peak hour and 196 trips during the PM peak hour. Compared to these estimates, the proposed development is anticipated to generate 205 (9%) additional weekday trips, including 7 (9%) more trips during the AM peak hour and 18 (9%) more trips during the PM peak hour.

Residential Land Use

To estimate the residential trip generation for the LHC/ADOT Feasibility Study's land use assumptions for the 91-acre site, the proposed Waterfront at Lake Havasu development's residential trip generation was adjusted to reflect a 37% increase in residential dwelling units. See **Table 4** for the LHC/ADOT Feasibility Study's residential trip generation calculations.

Table 4 – Trip Generation (LHC/ADOT Feasibility Study Residential Development)

| Land Use | ITE | Qty | Unit | Weekday | AM | Peak I | Hour | PM | Peak F | lour | | |
|--|---|--------|-------------------|-------------|-------|--------|------|-------|--------|------|--|--|
| Land OSC | LUC | Ϋ́ιy | Offic | Total | Total | ln | Out | Total | ln | Out | | |
| Pı | | | | | | | | | | | | |
| Recreational Homes (Single-Family Lots/Resort Villas) | 260 170 Dwelling Units 665 30 10 20 | | | | | | | | | | | |
| Multifamily Housing | 221 | 90 | Dwelling Units | 338 | 14 | 3 | 11 | 23 | 15 | 8 | | |
| Townhomes | 215 | 38 | Dwelling Units | 182 | 5 | 1 | 4 | 6 | 3 | 3 | | |
| | | | Subtotal | 1,185 | 49 | 14 | 35 | 84 | 49 | 35 | | |
| | | | Internal Trips | 297 | 6 | 3 | 3 | 33 | 23 | 10 | | |
| Total Proposed | Develop | oment | Residential Trips | 888 | 43 | 11 | 32 | 51 | 26 | 25 | | |
| LHC | ADOT | Feasib | ility Study Resid | dential Tri | ps | | | | | | | |
| Total LHC/ADOT Fe | Residential Trips | 1,410 | 69 | 18 | 51 | 81 | 41 | 40 | | | | |
| | -30 | -15 | -15 | | | | | | | | | |
| | Residential % Difference | | | | | | | | | | | |

The residential development in the LHC/ADOT Feasibility Study for the 91-acre site is anticipated to generate a total of 1,410 weekday trips, including 69 trips during the AM peak hour and 81 trips during the PM peak hour. Compared to these estimates, the proposed development is anticipated to generate 522 (37%) **fewer** weekday trips, including 26 (37%) **less** trips during the AM peak hour and 30 (37%) **less** trips during the PM peak hour.

6. TRIP GENERATION COMPARISON

When comparing both commercial and residential land uses, the proposed Waterfront at Lake Havasu development results in a net decrease of 317 (-8%) weekday trips—including 19 (-12%) less trips during the AM peak hour and 12 (-4%) less during the PM peak hour—than the LHC/ADOT Feasibility Study assumptions for the proposed development.

This demonstrates that the LHC/ADOT Feasibility Study assumed a more intensive development scenario than what is currently proposed, resulting in traffic projections that are conservative. As a result, the proposed Waterfront at Lake Havasu development is expected to have less overall traffic impact than what was shown in the LHC/ADOT Feasibility Study. A trip generation comparison is shown in Table 5.

Table 5 – Trip Generation Comparison (LHC/ADOT Feasibility Study vs. Proposed Development)

| Land Use | Weekday | AM | Peak H | Hour | PM | Hour | |
|--|---------|-------|--------|------|-------|------|-----|
| Lalid OSE | Total | Total | ln | Out | Total | ln | Out |
| Total Proposed Development Trips | 3,446 | 134 | 73 | 61 | 265 | 133 | 132 |
| Total LHC/ADOT Feasibility Study Trips | 3,763 | 153 | 75 | 78 | 277 | 139 | 138 |
| Total Difference | -317 | -19 | -2 | -17 | -12 | -6 | -6 |
| Total % Difference | -8% | -12% | -3% | -22% | -4% | -4% | -4% |

7. YEAR 2030 TRAFFIC VOLUMES & CAPACITY ANALYSIS

The LHC/ADOT Feasibility Study includes projected 2030 daily traffic volumes that reflect full build-out of the second bridge and assumed development of the 91-acre parcel with a more intensive land use scenario. **Table 6** shows existing 2022 daily volumes under the current one-bridge network and projected 2030 daily volumes with two bridges, as presented in the LHC/ADOT Feasibility Study. Roadways located on the island are highlighted in brown. See **Figure 7** for 2030 daily traffic volumes reported in the LHC/ADOT Feasibility Study.

A capacity analysis found:

- All island roadways will operate with acceptable levels of service (LOS), between 68% and 92% of available capacity
- Roadways on the mainland near the bridge will also operate with acceptable levels of service (LOS), between 37% and 85% of available capacity

This confirms that the roadway network **has the capacity** to support future traffic volumes with the proposed development in place.

Table 6 – Year 2030 Daily Traffic Volumes (LHC/ADOT Feasibility Study)
(Island Roadways in Brown)

Figure 7 | Year 2030 Daily Traffic Volumes (LHC/ADOT Feasibility Study)

Legend

8. SUMMARY

The traffic-related impacts of the proposed Waterfront at Lake Havasu development have been evaluated in the context of the Lake Havasu City Second Bridge Feasibility Study, completed in July 2024. Initiated by the City of Lake Havasu in coordination with the Arizona Department of Transportation (ADOT) and funded through a \$35.5 million state appropriation under Senate Bill 1722, the LHC/ADOT Feasibility Study was a robust and comprehensive planning effort. It incorporated detailed technical modeling, stakeholder input, and public engagement. The LHC/ADOT Feasibility Study outlined the need for the second bridge for emergency and evacuation purposes for scenarios that the London Bridge crossing was unpassable or experienced extensive access delay conditions for emergency and public safety.

At the time of the LHC/ADOT Feasibility Study, the development plan for the 91-acre site was still in the early stages of planning. However, the Waterfront at Lake Havasu team maintained close coordination with the City of Lake Havasu, and the Second Bridge project team to provide timely input on preliminary land use and site planning details. This collaborative effort helped ensure the study reflected informed, reasonable assumptions representative of anticipated development.

Since that time, the development plan has been refined—resulting in fewer residential units and a slight increase in commercial space compared to what was assumed in the LHC/ADOT Feasibility Study. A comparative analysis confirms that the proposed Waterfront at Lake Havasu development will generate fewer overall daily and peak-hour trips than the scenario originally modeled in the LHC/ADOT Feasibility Study.

Accordingly, the LHC/ADOT Feasibility Study's traffic analysis projected 2030 daily volumes based on a more intensive development scenario and full build-out of the second bridge. The capacity analysis concluded that all roadways on the island and adjacent mainland will continue to operate at acceptable levels of service, with available roadway capacity ranging from 37% to 92%.

- These findings confirm that the surrounding roadway network is well-equipped to accommodate traffic from the proposed development. Because the LHC/ADOT Feasibility Study assumed more traffic-intensive land uses for the 91-acre site, the proposed Waterfront at Lake Havasu development is expected to result in even less traffic-related impact than originally projected—further supporting the conclusion that no adverse impacts to the transportation system are anticipated.
- The Second Bridge effectively will mitigate the proposed Waterfront at Lake Havasu's traffic impacts.

- The LHC/ADOT Second Bridge Feasibility Study recommends improvements to the intersection of McCulloch Boulevard and the second bridge new roadway alignment/Beachcomber Boulevard.
- This Traffic Statement provides a high-level analysis of the future roadway network.
 More detailed traffic analyses of site driveways—including traffic operations, traffic controls, lane configurations, turn-lane storage requirements and lengths—should be completed once the site plan is further defined. All site access points should be evaluated to provide acceptable ingress and egress operations, queue storage, and traffic control.
